## Geometric Computations in Molecular Biology SSO7

Backbone hydrogen bonding patterns determine a protein's helices and sheets:
Of course, computers can't visualize proteins the same way we can, but must perform more laborious coordinate comparisons to determine structure. Most of these are surprisingly geometric - e.g. here is a list of all pairs of backbone N and O atoms with distances in ( $2.8 \AA, 3.15 \AA$ ) for one of the proteins from the matching game.
Determine the helix and sheet structure of this protein.
Then see if you can determine its PDB id.

| N | 6 | $\rightarrow 0$ | 3 | dist | 3.05 | N | 80 | -> 0 | - 78 | dist | 3.08 |
