Chapter 1

Libwindow - a small X11-library

This is a short and probably incomplete description of Libwindow, a small library which aims to present an easy C++ interface to the X11 window system. If you want to use the library in your program, do not forget the following include directive.

#include < IFM/window >

1.1 The Window Class (ifm::Wstream)

Definition

The class *ifm::Wstream* represents a window that can be used for IO-operations and an associated graphic context. The graphic context defines the drawing color (default: black), line width (default: 1) and drawing mode (default: *GXcopy*) and affects any output operation. There are a number of member functions to change the state of the graphic context. With the window comes a Cartesian coordinate system where the origin sits in the lower left corner, i.e., the window resides in the all-positive quadrant. All output is internally buffered, so in order to make it visible on the display, this buffer has to be flushed. Many functions handle *expose-events*, that means if parts of the window get obscured, their content is redrawn automatically, as soon as they get visible (exposed) again.

Creation

 $ifm::Wstream \ w(string str = "ifm::Wstream");$

Creates a window with dimensions (512×512) and name str and positions it with upper left corner (100, 100) on the X display (your screen).

 $ifm::Wstream \ w(int\ xsize,\ int\ ysize,\ string\ str="ifm::Wstream");$

Precondition: $10 \le xsize$, $ysize \le 2048$.

Creates a window with dimensions (xsize x ysize) and name str and positions it with upper left corner (100, 100) on the X display (your screen).

ifm::Wstream w(int xpos, int ypos, int xsize, int ysize, string str);

Precondition: $10 \le xsize$, $ysize \le 2048$.

Creates a window with dimensions (*xsize* x *ysize*) and name *str* and positions it with upper left corner (*xpos*, *ypos*) on the X display (your screen).

ifm::Wstream w(ifm::Wstream);

copy constructor.

ifm::Wstream &

w = ifm::Wstream

copy assignment.

Operations

int	w.xmin()	returns minimal x-xoordinate in w .
int	w.xmax()	returns maximal x-xoordinate in w .
int	w.ymin()	returns minimal y-xoordinate in w .
int	w.ymax()	returns maximal y-xoordinate in w .
ifm:: Wstream &		

& w << ifm::Drawable d

d is drawn into w.

ifm::Wstream &

& w >> ifm::Getable d

d is set from w.

ifm::Wstream &

w.flush() Buffer is flushed and all output drawn onto the

display. Returns w.

ifm::Wstream &

w.endl() same as flush.

ifm::Wstream &

w.sync() Buffer is flushed, all output is drawn onto the

display and all pending X-requests have been pro-

cessed. Returns w.

ifm::Wstream&

w.clear() Clears the window and flushes the buffer. Returns w.

ifm::Wstream&

w.wait(unsigned long microsec)

Flushes buffer and waits for microsec microseconds.

bool w.check_key()

Returns true, iff there is a KeyRelease event pending.

bool w.check_mouse()

Returns true, iff there is a MouseMotion event pending.

bool $w.check_mouse_click()$

Returns true, iff there is a ButtonRelease event pending.

 $int w.get_key()$

Flushes buffer, waits for a KeyRelease event and returns the pressed key's ASCII-code. (65 \Leftrightarrow A, 97 \Leftrightarrow a). Expose events during the waiting period are handled.

void w.get_mouse(int& x, int& y)

Flushes buffer, waits for a MouseMotion event and sets (x, y) to the mouse position. Expose events during the waiting period are handled.

int w.get_mouse_click(int& x, int& y)

Flushes buffer, waits for a ButtonRelease event, sets (x, y) to the mouse position and returns the number of the pressed mouse button. $(1 \Leftrightarrow \text{left}, 2 \Leftrightarrow \text{middle}, 3 \Leftrightarrow \text{right})$. Expose events during the waiting period are handled.

void $w.wait_for_mouse_click(int\ button = 0)$

Precondition: $0 \le button \le 3$. Flushes buffer and waits until specified $(0 \Leftrightarrow any)$ mouse button gets released. Expose events during the waiting period are handled.

ifm::Wstream&

 $w.set_draw_mode(int m)$

Drawing mode is set to m. (Possible values include GXcopy, GXxor, GXand,) Returns w.

```
ifm::Wstream \& \\ w.set\_line\_width(\ int\ w) \\ Precondition:\ w > 0. \\ Drawing\ line\ width\ is\ set\ to\ w.\ Returns\ w. \\ int w.number\_of\_colors() \\ Returns\ the\ number\ of\ available\ colors. \\ ifm::Wstream \& \\ w.set\_color(\ int\ c) \\ Precondition:\ 0 \le c \le number\_of\_colors(). \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ set\ to\ c.\ The\ last\ two\ colors \\ Drawing\ color\ is\ color\ colo
```

Drawing color is set to c. The last two colors are always black and white, i.e., $set_color(number_of_colors())$ selects black. The rest is evenly divided by interpolating the following colors in order: red, orange, yellow, green, blue, magenta and purple. Returns w.

Example

The following code reads in a Circle c, draws c and its bounding square and then tracks the mouse pointer by drawing line segments between consecutive positions until finally a mouse button is pressed.

```
#include <IFM/window>
int main()
    // define a 200 x 200 pixel window
    ifm::Wstream w(200, 200, "LibWindow-Example");
    // read in a circle
    ifm::Circle c;
    w >> c;
    // print c and its bounding square
    w << ifm::yellow << c << ifm::red
      << ifm::Rectangle(c.x() - c.r(), c.y() - c.r(),
                        c.x() + c.r(), c.y() + c.r())
      << ifm::flush;
    // tracks mouse pointer
    ifm::Point p_last(c.x(), c.y());
    do {
        int x, y;
        w.get_mouse(x, y);
        w << ifm::blue << ifm::Line(p_last.x(), p_last.y(), x, y)</pre>
          << ifm::flush;
```

```
p_last = ifm::Point(x, y);
} while (!w.check_mouse_click());
return 0;
}
```

1.2 A default Window

```
ifm::Wstream ifm::wio;
```

ifm::wio can be used whenever one default ifm::Wstream suffices. It is a so called proxy, i.e., the corresponding X-window and graphic context are created, when ifm::wio is used the first time. Consequently, if ifm::wio is not used anywhere, this creation does not happen and hence no window appears.

1.3 What can be drawn (ifm::Drawable)

Here is a list of classes/objects that can be drawn into an *ifm::Wstream* using the operator <<.

1.3.1 Points (*ifm::Point*)

```
ifm::Point \quad p(\ int\ x,\ int\ y); Creates a point with Cartesian coordinates (x,\ y). int \qquad p.x() \qquad \text{Returns x-coordinate of } p. int \qquad p.y() \qquad \text{Returns y-coordinate of } p.
```

Example

The following code draws a point at coordinate (100, 100) and waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::Point(100, 100) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.2 Line Segments (ifm::Line)

```
ifm::Line l(int x1, int y1, int x2, int y2);
```

Creates a line from (x1, y1) to (x2, y2).

int	l.x1()	Returns x-coordinate of the first endpoint.
int	l.y1()	Returns y-coordinate of the first endpoint.
int	l.x2()	Returns x-coordinate of the second endpoint.
int	l.y2()	Returns y-coordinate of the second endpoint.

Example

The following code draws a line segment from (100, 100) to (200, 200) and waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::Line(100, 100, 200, 200) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

Notes

Line Segments are somewhat special in X, since they do not include their endpoints, but only the grid points in between. So if you write

there does not appear a continuous line segment (100, 100) \longrightarrow (300, 100), it will have a one-pixel gap in the middle.

1.3.3 Rectangles (ifm::Rectangle)

```
ifm::Rectangle r(int x1, int y1, int x2, int y2);
```

Creates a rectangle with diagonal $(x1, y1) \longrightarrow (x2, y2)$.

```
r.x1() Returns x-coordinate of the diagonal's first endpoint. 

r.y1() Returns y-coordinate of the diagonal's first endpoint.
```

int	r.x2()	Returns x-coordinate endpoint.	of t	the	diagonal's	second
int	r.y2()	Returns y-coordinate endpoint.	of t	the	diagonal's	second

Example

The following code draws a rectangle with lower left corner (100, 100) and upper right corner (200, 200) and waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::Rectangle(100, 100, 200, 200) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.4 Filled Rectangles (ifm::FilledRectangle)

 $ifm::FilledRectangle \ r(int\ x1,\ int\ y1,\ int\ x2,\ int\ y2);$

Creates a filled rectangle with diagonal $(x1, y1) \longrightarrow (x2, y2)$. r.x1() Returns x-coordinate of the diagonal's first end-

point.

int r.y1() Returns y-coordinate of the diagonal's first end-

point.

r.x2() Returns x-coordinate of the diagonal's second

enapoint.

int r.y2() Returns y-coordinate of the diagonal's second endpoint.

Example

int

The following code draws a filled rectangle with lower left corner $(100,\,100)$ and upper right corner $(200,\,200)$ and waits for a mouseclick to finish.

1.3.5 Circles (ifm::Circle)

```
ifm::Circle \quad c(\ int\ x,\ int\ y,\ int\ r); Creates a circle with center (x,\ y) and radius r. int \qquad c.x() \qquad \text{Returns center's x-coordinate.} int \qquad c.y() \qquad \text{Returns center's y-coordinate.} int \qquad c.r() \qquad \text{Returns radius of } c.
```

Example

The following code draws a circle with center (100, 100) and radius 20. Then it waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::Circle(100, 100, 20) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.6 Filled Circles (ifm::FilledCircle)

Example

The following code draws a filled circle with center (100, 100) and radius 20. Then it waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::FilledCircle(100, 100, 20) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.7 Ellipses (ifm::Ellipse)

Example

The following code draws an ellipse with center (100, 100), width 80 and height 50. Then it waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::Ellipse(100, 100, 80, 50) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.8 Filled Ellipses (ifm::FilledEllipse)

Example

The following code draws a filled ellipse with center (100, 100), width 80 and height 50. Then it waits for a mouseclick to finish.

```
#include <IFM/window>
int main()
{
    ifm::wio << ifm::FilledEllipse(100, 100, 80, 50) << ifm::flush;
    ifm::wio.wait_for_mouse_click();
    return 0;
}</pre>
```

1.3.9 Manipulators

The manipulators listed here correspond to the respective member functions of *ifm::Wstream*.

The functionality can be looked up there.

```
ifm::Wstream&
                 ifm::Wstream \& w << ifm::flush
ifm::Wstream&
                 ifm::Wstream \& w << ifm::endl
ifm::Wstream&
                 ifm::Wstream \& w << ifm::sync
ifm::Wstream&
                 ifm::Wstream \& w << ifm::clear
ifm::Wstream&
                 ifm::Wstream& w << ifm::wait(unsigned long)
ifm::Wstream&
                 ifm::Wstream \& w << ifm::line\_width(int)
ifm::Wstream&
                 ifm::Wstream \& w << ifm::draw_mode(int)
ifm::Wstream&
                 ifm::Wstream \& w << ifm::color(int)
```

Shortcuts for Drawing Modes

```
\begin{array}{lll} ifm::Wstream \& & ifm::Wstream \& \ w << ifm::copy\_mode \\ ifm::Wstream \& & ifm::Wstream \& \ w << ifm::xor\_mode\_mode \\ ifm::Wstream \& & w << ifm::or\_mode \\ ifm::Wstream \& \ w << ifm::and\_mode \\ \end{array}
```

Shortcuts for Colors

```
ifm::Wstream&
                 ifm::Wstream \& w << ifm::white
ifm::Wstream&
                 ifm::Wstream \& w << ifm::black
ifm::Wstream&
                 ifm::Wstream \& w << ifm::red
ifm::Wstream&
                 ifm::Wstream \& w << ifm::orange
ifm::Wstream&
                 ifm::Wstream \& w << ifm::yellow
ifm::Wstream&
                 ifm::Wstream \& w << ifm::green
ifm::Wstream&
                 ifm::Wstream& w << ifm::lightgreen
ifm::Wstream&
                 ifm::Wstream \& w << ifm::blue
ifm::Wstream&
                 ifm::Wstream \& w << ifm::magenta
ifm::Wstream&
                 ifm::Wstream \& w << ifm::purple
```

1.4 What can be read (ifm::Getable)

Here is a list of classes/objects that can be read from an *ifm::Wstream* using the operator >>.

 $ifm::Point,\ ifm::Line,\ ifm::Rectangle,\ ifm::FilledRectangle,\ ifm::Circle,\ ifm::Ellipse,\\ ifm::FilledCircle,\ and\ ifm::FilledEllipse.$

Chapter 2

Libturtle - Turtle Graphics

This is a short description of Libturtle, a small turtle graphic library based on Libwindow. If you want to use the library in your program, do not forget the following include directive.

```
\#include < IFM/turtle >
```

Imagine a turtle walking on the Euclidean plane and leaving a trace behind it. At any time, the turtle has a certain position and a view direction. Initially, it is looking to the right. You can influence these parameters using the following functions.

```
void ifm::forward(unsigned\ int\ i=1)
```

Move the turtle i steps in view direction.

```
void \quad ifm::left(int d = 1)
```

Turn the turtle left by an angle of d degree.

```
void \quad ifm::right(int d = 1)
```

Turn the turtle right by an angle of d degree.

When the drawing is complete, i.e., at the end of the program, it is shown in a window of 512×512 pixels, appropriately scaled to use the space available. A mouseclick then destroys the window and ends the program.

Example

The following code draws a regular pentagon. Then it waits for a mouseclick to finish.

```
#include <IFM/turtle>
int main()
```

```
{
    for (unsigned int i = 0; i < 5; ++i) {
        ifm::forward();
        ifm::left(72);
    }
    return 0;
}</pre>
```
