

# Graph Theory

## Graphs – Definition

---

A **graph**  $G$  is a pair consisting of

- a vertex set  $V(G)$ , and
- an edge set  $E(G) \subseteq \binom{V(G)}{2}$ .

$x$  and  $y$  are the **endpoints** of edge  $e = \{x, y\}$ .

They are called **adjacent** or **neighbors**.

$e$  is called **incident** with  $x$  and  $y$ .

## Multigraphs: Extension & Confusion\_\_\_\_\_

A **loop** is an edge whose endpoints are equal.

**Multiple edges** are edges having the same set of endpoints.

Our book allows both loops and multiple edges in “graphs”. We don’t – at least when we say “graph”. When we do want to allow multiple edges or loops we say **multigraph**. When the book wants to talk about a graph without multiple edges and loops, it says **simple graph**.\*

**Remarks** A multigraph might have no multiple edges or loops. Every (simple) graph is a multigraph, but not every multigraph is a (simple) graph.

Every graph is finite.†

\*Sometimes even we say “simple graph”, when we would like to emphasize that there are no multiple edges and loops.

†in this course

## Special graphs ---

$K_n$  is the complete graph on  $n$  vertices.

$K_{n,m}$  is the complete bipartite graph with partite sets of sizes  $n$  and  $m$ .

$P_n$  is the path on  $n$  vertices

$C_n$  is the cycle on  $n$  vertices

## Further definitions

---

The **degree** of vertex  $v$  is the number of edges incident with  $v$ .

A set of pairwise adjacent vertices in a graph is called a **clique**. A set of pairwise non-adjacent vertices in a graph is called an **independent set**.

A graph  $G$  is **bipartite** if  $V(G)$  is the union of two (possibly empty) independent sets of  $G$ . These two sets are called the **partite sets** of  $G$ .

The **complement**  $\overline{G}$  of a graph  $G$  is a graph with

- vertex set  $V(\overline{G}) = V(G)$  and
- edge set  $E(\overline{G}) = \binom{V}{2} \setminus E(G)$ .

$H$  is a **subgraph** of  $G$  if  $V(H) \subseteq V(G)$ ,  $E(H) \subseteq E(G)$ . We write  $H \subseteq G$ . We also say  $G$  **contains**  $H$  and write  $G \supseteq H$ .

The Petersen graph\_\_\_\_\_

$$V(P) = \binom{[5]}{2}$$

$$E(P) = \{\{A, B\} : A \cap B = \emptyset\}$$

### Properties.

- each vertex has degree 3 (i.e.  $P$  is 3-regular)
- adjacent vertices have no common neighbor
- non-adjacent vertices have exactly one common neighbor

**Corollary.** The girth of the Petersen graph is 5.

The **girth** of a graph is the length of its shortest cycle.

## Isomorphism of graphs\_\_\_\_\_

An **isomorphism** of  $G$  to  $H$  is a **bijection**  $f : V(G) \rightarrow V(H)$  such that  $uv \in E(G)$  **iff**\*  $f(u)f(v) \in E(H)$ . If there is an isomorphism from  $G$  to  $H$ , then we say  **$G$  is isomorphic to  $H$** , denoted by  **$G \cong H$** .

**Claim.** The isomorphism relation is an equivalence relation on the set of all graphs.

An **isomorphism class** of graphs is an equivalence class of graphs under the isomorphism relation.

*Example.* What are those graphs for which the adjacency relation is an equivalence relation?

**Remark.** labeled vs. unlabeled

“unlabeled graph”  $\approx$  “isomorphism class”.

*Example.* What is the number of labeled and unlabeled graphs on  $n$  vertices?

\*if and only if

## Equivalence relation\_\_\_\_\_

A **relation** on a set  $S$  is a subset of  $S \times S$ .

A relation  $R$  on a set  $S$  is an **equivalence relation** if

1.  $(x, x) \in R$  ( $R$  is **reflexive**)
2.  $(x, y) \in R$  implies  $(y, x) \in R$  ( $R$  is **symmetric**)
3.  $(x, y) \in R$  and  $(y, z) \in R$  imply  $(x, z) \in R$   
( $R$  is **transitive**)

An equivalence relation defines a **partition** of the base set  $S$  into **equivalence classes**. Elements are in relation **iff** they are within the same class.

# Isomorphism classes \_\_\_\_\_

## Automorphisms

---

An **automorphism** of  $G$  is an isomorphism of  $G$  to  $G$ . A graph  $G$  is **vertex transitive** if for every pair of vertices  $u, v$  there is an automorphism that maps  $u$  to  $v$ .

*Examples.*

- Automorphisms of  $P_4$
- Automorphisms of  $K_{r,s}$
- Automorphisms of Petersen graph.

A **decomposition** of a graph is a list of subgraphs such that each edge appears in exactly one subgraph in the list.

A graph is **self-complementary** if it is isomorphic to its complement.

*Example.*  $P_4, C_5$

## Adjacency matrix of a graph\_\_\_\_\_

Let  $G$  be a graph with vertex set  $V(G) = \{v_1, \dots, v_n\}$ . The **adjacency matrix**  $A(G)$  of  $G$  is an  $n \times n$  matrix in which entry  $a_{i,j}$  is the number of edges whose endpoints are  $v_i$  and  $v_j$ .

## Walks, trails, paths, and cycles\_\_\_\_\_

A **walk** is an alternating list  $v_0, e_1, v_1, e_2, \dots, e_k, v_k$  of vertices and edges such that for  $1 \leq i \leq k$ , the edge  $e_i$  has endpoints  $v_{i-1}$  and  $v_i$ .

A **trail** is a walk with no repeated edge.

A **path** is a walk with no repeated vertex.

A  $u, v$ -walk,  $u, v$ -trail,  $u, v$ -path is a walk, trail, path, respectively, with first vertex  $u$  and last vertex  $v$ .

If  $u = v$  then the  $u, v$ -walk and  $u, v$ -trail is **closed**. A closed trail (without specifying the first vertex) is a **circuit**. A circuit with no repeated vertex is called a **cycle**.

The **length** of a walk trail, path or cycle is its number of edges.

## Connectivity

---

$G$  is **connected**, if there is a  $u, v$ -path for every pair  $u, v \in V(G)$  of vertices.

Otherwise  $G$  is **disconnected**.

Vertex  $u$  is **connected to** vertex  $v$  in  $G$  if there is a  $u, v$ -path. The **connection relation** on  $V(G)$  consists of the ordered pairs  $(u, v)$  such that  $u$  is connected to  $v$ .

**Claim.** The connection relation is an equivalence relation.

**Lemma.** Every  $u, v$ -walk contains a  $u, v$ -path.

The **connected components** of  $G$  are its maximal connected subgraphs (i.e. the equivalence classes of the connection relation).

An **isolated vertex** is a vertex of degree 0. It is a connected component on its own, called **trivial** connected component.

## Strong Induction

---

**Theorem 1.** (Principle of Induction) Let  $P(n)$  be a statement with integer parameter  $n$ . If the following two conditions hold then  $P(n)$  is true for each positive integer  $n$ .

1.  $P(1)$  is true.
2. For all  $n > 1$ , “ $P(n - 1)$  is true” implies “ $P(n)$  is true”.

**Theorem 2.** (Strong Principle of Induction) Let  $P(n)$  be a statement with integer parameter  $n$ . If the following two conditions hold then  $P(n)$  is true for each positive integer  $n$ .

1.  $P(1)$  is true.
2. For all  $n > 1$ , “ $P(k)$  is true for  $1 \leq k < n$ ” implies “ $P(n)$  is true”.

## Cutting a graph

---

**Proposition.** Every graph with  $n$  vertices and  $k$  edges has at least  $n - k$  components.

A **cut-edge** or **cut-vertex** of  $G$  is an edge or a vertex whose deletion increases the number of components.

If  $M \subseteq E(G)$ , then  $G - M$  denotes the graph obtained from  $G$  by the deletion of the elements of  $M$ ;  $V(G - M) = V(G)$  and  $E(G - M) = E(G) \setminus M$ . Similarly, for  $S \subseteq V(G)$ ,  $G - S$  obtained from  $G$  by the deletion of  $S$  and all edges incident with a vertex from  $S$ .

For  $e \in E(G)$ ,  $G - \{e\}$  is abbreviated by  $G - e$ .

For  $v \in V(G)$ ,  $G - \{v\}$  is abbreviated by  $G - v$ .

**Theorem.** An edge  $e$  is a cut-edge **iff** it does not belong to a cycle.
