Graph Theory

Problem Set 4

Course Webpage: <http://www.ti.inf.ethz.ch/ew/courses/GT04/>

Due Date: November 17, 2004 at the lecture

Exercise 4.1

(Exercise 2.1.8 in the Textbook)

(–) Prove that each property below characterizes forests.

- Every induced subgraph has a vertex of degree at most 1.
- Every connected subgraph is an induced subgraph.
- The number of components is the number of vertices minus the number of edges.

An **induced subgraph** is a subgraph obtained by deleting a set of vertices. We write $G[U]$ for $G - \bar{U}$, where $\bar{U} = V(G) - U$; this is the subgraph of G induced by U . In other words, $G[U]$ is a subgraph of G with vertex set U which contains all the edges $xy \in E(G)$ with $x, y \in U$.

Exercise 4.2

(Exercise 2.1.27 in the Textbook)

(!) Let d_1, \dots, d_n be positive integers, with $n \geq 2$. Prove that there exists a tree with vertex degrees d_1, \dots, d_n if and only if $\sum_{i=1}^n d_i = 2n - 2$.

Exercise 4.3

(Exercise 2.1.37 in the Textbook)

(!) Let T, T' be two spanning trees of a connected graph G . For any $e \in E(T) - E(T')$, prove that there exists an edge $e' \in E(T') - E(T)$ such that both $T' + e - e'$ and $T - e + e'$ become spanning trees of G simultaneously.

Exercise 4.4

(Exercise 2.1.47 in the Textbook)

(!) If a graph G has a u, v -path, then the **distance** from u to v , denoted by $d_G(u, v)$ or simply $d(u, v)$, is the least length of a u, v -path. (Remember the length of path is the number of its edges.) If G has no such path, then $d(u, v) = \infty$. The **diameter** of G is $\max_{u, v \in V(G)} d(u, v)$ and denoted by $\text{diam } G$. The **eccentricity** of a vertex u is $\max_{v \in V(G)} d(u, v)$, and denoted by $\epsilon(u)$. The **radius** of a graph G is $\min_{u \in V(G)} \epsilon(u)$, and denoted by $\text{rad } G$.

- Prove that the distance function $d(u, v)$ on pairs of vertices of graph satisfies the triangle inequality: $d(u, v) + d(v, w) \geq d(u, w)$.
- Use part (a) to prove that $\text{diam } G \leq 2 \text{rad } G$ for every graph G .
- For all positive integers r and d that satisfy $r \leq d \leq 2r$, construct a simple graph with radius r and diameter d . (Hint: Build a suitable graph with one cycle.)

Exercise 4.5

(Exercise 2.3.14 in the Textbook)

(!) Let C be a cycle in a connected weighted graph. Let e be an edge of maximum weight on C . Prove that there is a minimum-weight spanning tree not containing e . Use this to prove that iteratively deleting a heaviest non-cut-edge until the remaining graph is acyclic produces a minimum-weight spanning tree.

To be continued on the back side...

Exercise 4.6

(Exercise not in the Textbook)

(+) Let k be a positive integer.

- a) Prove that every simple n -vertex graph with more than $n(k-1) - \binom{k}{2}$ edges contains **all** trees with k edges, if $n > k$. (Hint: Try to prove and use the following claim: If $\delta(G) \geq k$ then G contains all trees with k edges.)
- b) For every k , construct a simple n -vertex graph, for some $n > k$, with $n(k-1)/2$ edges which contains **no** tree with k edges.
- c) For $k \in \{1, 2, 3\}$, prove that every simple n -vertex graph with more than $n(k-1)/2$ edges contains **all** trees with k edges.
